### Celebrex

### Description

Celebrex (celecoxib)

### **Background**

Celebrex (celecoxib) is commonly referred to as a COX-2 selective inhibitor. The mechanism of action of Celebrex is believed to be inhibition of prostaglandin synthesis, primarily via inhibition of cyclooxygenase-2 (COX-2). It is classified as a NSAID, which have become synonymous with the management of acute musculoskeletal injuries. NSAIDs reduce pain through their inhibition of the enzyme cyclooxygenase (COX), leading to a significant decrease in prostaglandin production. COX exists as two isoenzymes, COX-1 and COX-2. COX-1 enzyme exists in many body tissues, including the stomach. Most frequent side effects on the gastrointestinal tract are a result of the COX-1 inhibition, the most common being gastritis and upper gastrointestinal ulcer and bleeding. COX-2 enzyme is associated with inflammation in the joints. Selective inhibition of COX-2 should lead to decreased inflammation in musculoskeletal tissues and, by sparing COX-1, to a decrease in the incidence of GI mucosal injury (1-3).

#### **Regulatory Status**

FDA-approved indications: Celebrex is a nonsteroidal anti-inflammatory drug FDA indicated for Osteoarthritis (OA), Rheumatoid Arthritis (RA), Juvenile Rheumatoid Arthritis (JRA) in patients 2 years and older, Ankylosing Spondylitis (AS), Acute Pain (AP), and Primary Dysmenorrhea (PD) (1).

#### Off-Label Use: (4)

Celebrex has been shown to be safe and effective as adjunctive therapy in treating chronic synovitis and joint pain in patients with hemophilia.

Section: Prescription Drugs Effective Date: April 1, 2023

Subsection: Analgesics and Anesthetics Original Policy Date: September 8, 2011

Subject: Celebrex Page: 2 of 7

Celebrex has a boxed warning regarding the gastrointestinal, cardiovascular, bleeding and renal risk. Celebrex can cause peptic ulcers, GI bleeding, and/or perforation of the stomach or intestines, which can be fatal. NSAIDS may cause an increased risk of serious CV thrombotic events, myocardial infarction, and stroke, which can be fatal. This risk may increase with duration of use. Patients with CV disease or risk factors for CV disease may be at greater risk. Celebrex is contraindicated for treatment of peri-operative pain in the setting of coronary artery bypass graft (CABG) surgery. Celebrex is contraindicated in patients with peptic ulcer disease or history of GI bleeding. Celebrex is contraindicated in patients with advanced renal impairment and in patients at risk for renal failure due to volume depletion (1).

Principal risk factors for serious GI events and hospitalization were age, smoking, use of alcohol, a history of prior NSAID-related ulceration and its complications, corticosteroid or anticoagulant use, and debilitating disorders such as cardiovascular disease. The use of low-dose aspirin alone, in the absence of other risk factors is associated with an increased risk for both GI bleeding and death from GI complications (3).

NSAIDs should be prescribed with extreme caution in patients with a prior history of ulcer disease or gastrointestinal bleeding. To minimize the potential risk for an adverse GI event, the lowest effective dose should be used for the shortest duration consistent with individual patient treatment goals. Physicians and patients should remain alert for signs and symptoms of GI ulceration and bleeding during Celebrex therapy and promptly initiate additional evaluation and treatment if a serious GI adverse event is suspected. For high-risk patients, alternate therapies that do not involve NSAIDs should be considered. Celebrex is contraindicated in patients with active GI bleeding (1).

The safety and effectiveness of Celebrex have not been established in pediatric patients under the age of 2 years, in patients with body weight less than 10kg (22 lbs), and in patients with active systemic features (1).

### **Policy**

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Celebrex may be considered **medically necessary** in patients 2 years of age or older for the treatment of acute pain, osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, primary

Section: Prescription Drugs Effective Date: April 1, 2023

Subsection: Analgesics and Anesthetics Original Policy Date: September 8, 2011

Subject: Celebrex Page: 3 of 7

dysmenorrhea or chronic synovitis or joint pain in patients with hemophilia; and if the conditions indicated below are met.

Celebrex may be considered **investigational** for patients below 2 years of age and for all other indications.

### **Prior-Approval Requirements**

Prior authorization is not required if the patient has filled a prescription of at least one pharmacologic indicator of a risk factor for developing gastrointestinal (GI) adverse events (e.g., anticoagulant therapy, antiplatelet therapy or oral corticosteroid therapy) OR at least one non-steroidal anti-inflammatory drug (NSAID) prescription (e.g., NSAID or NSAID/GI combination product) OR at least one gastrointestinal medication prescription (e.g., proton pump inhibitor [PPI], histamine type 2 receptor antagonist [H2 antagonist], misoprostol, or sucralfate) within the past 365 days.

**Age** 2 years of age or older

#### **Diagnoses**

Patient must have **ONE** of the following:

- 1. Acute Pain
- 2. Rheumatoid Arthritis
- 3. Osteoarthritis
- 4. Juvenile rheumatoid arthritis (JRA)
- 5. Ankylosing Spondylitis
- 6. Primary Dysmenorrhea
- 7. Chronic synovitis or joint pain associated with hemophilia

### Prior – Approval Renewal Requirements

Age 2 years of age or older

#### **Diagnoses**

Patient must have **ONE** of the following:

Section: Prescription Drugs Effective Date: April 1, 2023

- 7. Chronic synovitis or joint pain associated with hemophilia

### **Policy Guidelines**

### **Pre - PA Allowance**

Age 2 years of age or older

### Quantity

Strength	Quantity
50 mg	360 capsules per 365 days OR
100 mg	360 capsules per 365 days OR
200 mg	180 capsules per 365 days OR
400 mg	180 capsules per 365 days

**Duration** 365 days

### **Prior - Approval Limits**

### Quantity

Strength	Quantity
50 mg	
100 mg	Up to 400 mg per day in any
200 mg	combination
400 mg	

**Duration** 12 months

### Prior - Approval Renewal Limits

Section: Prescription Drugs Effective Date: April 1, 2023

Subsection: Analgesics and Anesthetics Original Policy Date: September 8, 2011

Subject: Celebrex Page: 5 of 7

Same as above

### Rationale

#### **Summary**

NSAIDs have become synonymous with the management of acute musculoskeletal injuries. They are some of the most widely used medications, and are reliable and effective when used appropriately for pain relief and to reduce inflammation. NSAIDs reduce pain through their inhibition of the enzyme cyclooxygenase (COX), leading to a significant decrease in prostaglandin production. COX exists as two isoenzymes, COX-1 and COX-2. COX-2 inhibitors are associated with a significantly lower incidence of gastric and duodenal ulcers when compared to traditional NSAIDs. Celebrex is contraindicated in patients with active GI bleeding. The mechanism of action of Celebrex is believed to be inhibition of prostaglandin synthesis, primarily via inhibition of cyclooxygenase-2 (COX-2). It does not inhibit the cyclooxygenase-1 (COX-1). Celebrex is commonly referred to as a COX-2 selective inhibitor (1).

Prior authorization is required to ensure the safe, clinically appropriate, and cost-effective use of Celebrex while maintaining optimal therapeutic outcomes.
