MS Injectable Drugs

Description

Avonex, Rebif (interferon beta-1a); **Plegridy** (peginterferon beta-1a); **Betaseron**, Extavia (interferon beta-1b); Copaxone*(**glatiramer acetate**), **Glatopa (glatiramer acetate)**

Preferred MS injectable products: Avonex, Rebif, Plegridy, Betaseron, generic glatiramer acetate and Glatopa.

*Prior authorization for the brand formulation applies only to formulary exceptions due to being a non-covered medication.

Background

Plegridy (peginterferon beta-1a), Avonex / Rebif (interferon beta-1a), Betaseron / Extavia (interferon beta-1b), and Copaxone / Glatopa (glatiramer) are multiple sclerosis (MS) disease-modifying agents. They potentially alter the course of disease by lessening the frequency of clinical exacerbations. Avonex and Rebif may also delay the accumulation of physical disability (1-7).

Avonex / Rebif and Betaseron / Extavia are different brands of the same generic entity, interferons beta-1a and b respectively, recombinant forms of human interferon proteins. Plegridy is a PEG (poly-ethylene glycol)-attached form of interferon beta-1a. Copaxone / Glatopa (glatiramer) is a non-interferon polypeptide consisting of four amino acids. Although their precise mechanisms of action are unknown, the agents affect the body through the immune system (1-7).

Regulatory Status

FDA-approved indications:

Avonex is an interferon beta indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults (1).

Betaseron / Extavia is an interferon beta indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults (2, 4).

Glatopa is indicated for the treatment of patients with relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults (7). **Copaxone / Plegridy** is indicated for the treatment of relapsing forms of multiple sclerosis (MS), to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults (3, 5).

Rebif is an interferon beta indicated for the treatment of patients with relapsing forms of multiple sclerosis, to include clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease, in adults (6).

The MS injectable drugs should be used with precaution in patients with mood or psychiatric disorders and hepatic impairment (1-7).

Live, attenuated vaccines are generally not recommended for a person with MS because their ability to cause disease has been weakened but not totally inactivated (8).

Safety and effectiveness of the MS injectable drugs in patients younger than 18 years of age have not been established (1-7).

The MS injectable drugs may be considered **medically necessary** if the conditions indicated below are met.

The MS injectable drugs may be considered **investigational** for all other indications.

Prior-Approval Requirements

Age 18 years of age and older

Diagnosis

Patient must have the following:

1. Relapsing Multiple Sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease
 - a. **NOT** used in combination with another MS disease modifying agent
 - b. **NOT** given concurrently with live vaccines
 - c. **Extavia only:** Patient **MUST** have tried generic Copaxone: glatiramer acetate **AND ONE** of the other preferred MS medications (see Appendix 1) unless the patient has a valid medical exception (e.g., inadequate treatment response, intolerance, contraindication)

Prior – Approval *Renewal* Requirements

Same as above

Policy Guidelines

Pre - PA Allowance

None

Prior - Approval Limits

Duration 2 years

Rationale

Summary

Plegridy (peginterferon beta-1a), Avonex / Rebif (interferon beta-1a), Betaseron / Extavia (interferon beta-1b), and Copaxone / Glatopa (glatiramer) are multiple sclerosis (MS) disease-modifying agents. They potentially alter the course of disease by lessening the frequency of clinical exacerbations. Avonex and Rebif may also delay the accumulation of physical disability (1-7).

Prior authorization is required to ensure the safe, clinically appropriate, and cost-effective use of the MS injectable drugs while maintaining optimal therapeutic outcomes.

Appendix 1 - List of Preferred Multiple Sclerosis (MS) Medications

Medication Name	Route of Administration
Avonex	Injectable
Betaseron	Injectable
glatiramer acetate* (generic Copaxone) *must try this drug plus one other preferred MS medication oral or injectable	Injectable
Glatopa	Injectable
Plegridy	Injectable
Rebif	Injectable

Medication Name	Route of Administration
dimethyl fumarate (generic Tecfidera)	Oral**
fingolimod (generic Gilenya)	Oral**
Mayzent	Oral**
teriflunomide (generic Aubagio)	Oral**
Zeposia	Oral**

** indicates separate criteria will need to be met
