## Diacomit

### Description

#### Diacomit (stiripentol)

---

#### Background

Diacomit (stiripentol) is indicated for the treatment of seizures associated with Dravet syndrome (DS) in patients taking clobazam who are 6 months of age and older and weighing 7 kg or more. The mechanism by which Diacomit exerts its anticonvulsant effects in humans is unknown. Possible mechanisms of action include direct effects mediated through the gamma-aminobutyric acid (GABA)<sub>A</sub> receptor and indirect effects involving inhibition of cytochrome P450 activity with resulting increase in blood levels of clobazam and its active metabolite (1).

#### Regulatory Status

FDA-approved indication: Diacomit is indicated for the treatment of seizures associated with Dravet syndrome in patients taking clobazam who are 6 months of age and older and weighing 7 kg or more. There is no clinical data to support the use of Diacomit as monotherapy in Dravet syndrome (1).

Diacomit can cause somnolence. Co-administration of Diacomit with clobazam results in increased levels of clobazam and its active metabolite, which can further increase somnolence. Other CNS depressants, such as alcohol, could potentiate the somnolence effect of Diacomit (1).

Diacomit can cause a significant decline in platelet count and neutrophil count. Hematologic testing should be obtained prior to starting treatment with Diacomit, and then every 6 months (1).

<b>Subsection:</b>	Neuromuscular Agents	<b>Original Policy Date:</b>	September 7, 2018
<b>Subject:</b>	Diacomit	<b>Page:</b>	2 of 5

---

As with most antiepileptic drugs, Diacomit should generally be withdrawn gradually to minimize the risk of increased seizure frequency and status epilepticus. In situations where rapid withdrawal of Diacomit is required, appropriate monitoring is recommended (1).

Most patients with DS require two or more drugs to achieve seizure control, and choice of drugs should be individualized based on considerations of efficacy as well as side effects, tolerability, and access. Typically, a stepwise approach is taken, using valproate as a first-line drug in most patients and then adding clobazam if seizures remain poorly controlled despite adequate valproate dosing and serum levels (2).

The safety and effectiveness of Diacomit in pediatric patients less than 6 months of age or weighing less than 7 kg have not been established (1).

Epidiolex, Fintepla, Nayzilam, Valtoco

## Policy

*This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.*

Diacomit may be considered **medically necessary** if the conditions indicated below are met.

Diacomit may be considered **investigational** for all other indications.

## Prior-Approval Requirements

**Age** 6 months of age and older

### Diagnosis

Patient must have the following:

Seizures associated with Dravet syndrome (DS)

**AND ALL** of the following:

1. Must be used in combination with clobazam
  - a. Patient has had an inadequate response to clobazam
2. Prescriber agrees to monitor blood counts before initiating therapy and then

---

- every 6 months while on therapy
- Inadequate treatment response, intolerance, or contraindication to at least **ONE** of the following medications:
    - Valproate / Valproic acid (i.e., Depakote, Depacon)
    - Lamotrigine
    - Levetiracetam
    - Banzel (rufinamide)
    - Topiramate
    - Felbamate
  - Patient weight  $\geq 7$  kg
  - Prescriber will not exceed the FDA labeled dose of 50 mg/kg/day

---

## Prior – Approval *Renewal* Requirements

**Age** 6 months age and older

### Diagnosis

Patient must have the following:

Seizures associated with Dravet syndrome (DS)

**AND ALL** of the following:

- Must be used in combination with clobazam
- Prescriber agrees to monitor blood counts every 6 months while on therapy
- Patient weight  $\geq 7$  kg
- Prescriber will not exceed the FDA labeled dose of 50 mg/kg/day

## Policy Guidelines

### Pre - PA Allowance

None

### Prior - Approval Limits

**Quantity** Maximum daily dose of 50 mg/kg/day

**Duration** 12 months

<b>Section:</b>	Prescription Drugs	<b>Effective Date:</b>	April 1, 2024
<b>Subsection:</b>	Neuromuscular Agents	<b>Original Policy Date:</b>	September 7, 2018

## Prior – Approval *Renewal* Limits

Same as above

## Rationale

### Summary

Diacomit (stiripentol) is indicated for the treatment of seizures associated with Dravet syndrome (DS) in patients taking clobazam 6 months of age and older and weighing 7 kg or more. The mechanism by which Diacomit exerts its anticonvulsant effects in humans is unknown. Possible mechanisms of action include direct effects mediated through the gamma-aminobutyric acid (GABA)<sub>A</sub> receptor and indirect effects involving inhibition of cytochrome P450 activity with resulting increase in blood levels of clobazam and its active metabolite. The safety and effectiveness of Diacomit in pediatric patients less than 6 months of age or weighing less than 7 kg have not been established (1).

Prior authorization is required to ensure the safe, clinically appropriate, and cost-effective use of Diacomit while maintaining optimal therapeutic outcomes.
