Provigil Nuvigil

Description

Provigil (modafinil) / Nuvigil (armodafinil)

Background

Provigil and Nuvigil are central nervous system stimulants. The Drug Enforcement Administration (DEA) has listed Provigil and Nuvigil as Schedule IV drugs. The mechanism through which Provigil and Nuvigil promote wakefulness is unknown. They have wake-promoting actions similar to sympathomimetic agents including amphetamine and methamphetamine, but the pharmacologic profile is not identical to that of the sympathomimetic amines (1-2).

Regulatory Status

FDA-approved indications: (1-2)

- Provigil is indicated for improving wakefulness in adult patients with excessive sleepiness associated with narcolepsy, obstructive sleep apnea (OSA), or shift work disorder.
- Nuvigil is indicated for improving wakefulness in adult patients with excessive sleepiness associated with obstructive sleep apnea (OSA), narcolepsy, or shift work disorder.

Limitations of Use: (1-2)

In OSA, Provigil and Nuvigil are indicated to treat excessive sleepiness and not as treatment for the underlying obstruction.

Off-Label Uses:

- Provigil and Nuvigil are used as adjuncts to standard treatments for OSA (3-4)
- Provigil has been found effective in the treatment of multiple sclerosis fatigue. Provigil is

a unique wake-promoting agent that is chemically distinct from traditional stimulants. Results of a placebo-controlled study showed it to significantly improve fatigue and sleepiness and to be well tolerated by patients with multiple sclerosis (MS). For MS patients who experience significant fatigue there are several medications that have proven effective in this regard. Provigil is among the most commonly used medications for fatigue associated with MS and according to expert opinion, is currently a first-line drug for MS patients (5-6).

Idiopathic hypersomnia, a condition similar to narcolepsy, is characterized by constant or recurrent daytime sleepiness with no other cause of sleepiness, prolonged nocturnal sleep, difficulty awakening with sleep drunkenness, and long unrefreshing naps with no history of cataplexy. Provigil has proven effective in treating idiopathic hypersomnia in one case series and several open-label trials. The practice parameters for the treatment of narcolepsy and other hypersomnias of central origin state that Provigil may be effective for the treatment of daytime sleepiness due to idiopathic hypersomnia. As there may be underlying causes/behaviors associated with EDS, a sleep specialist physician has the training to correctly recognize and diagnose this condition. While Nuvigil has not been studied for this use, expert opinion considers it to be interchangeable with Provigil for this condition (4).

Policy

This policy statement applies to clinical review performed for pre-service (Prior Approval, Precertification, Advanced Benefit Determination, etc.) and/or post-service claims.

Nuvigil and Provigil may be considered **medically necessary** if the conditions indicated below are met.

Nuvigil and Provigil may be considered **investigational** for all other indications.

Prior-Approval Requirements

Age 16 years of age or older

Diagnoses

Section:	Prescription Drugs	Effective Date:	January 1, 2025

Rationale

Summary

Section:	Prescription Drugs	Effective Date:	January 1, 2025
Subsection:	Central Nervous System Drugs	Original Policy Date:	May 1, 2009
Subject:	Provigil Nuvigil	Page:	4 of 6

Provigil and Nuvigil are central nervous system stimulants used to increase wakefulness in adult patients with narcolepsy, shift work sleep disorder, and obstructive sleep apnea. The Drug Enforcement Administration (DEA) has listed Provigil and Nuvigil as Schedule IV drugs. They are also used off-label to treat MS fatigue (1-6).

Prior authorization is required to ensure the safe, clinically appropriate, and cost-effective use of Provigil and Nuvigil while maintaining optimal therapeutic outcomes.

Policy History

Date	Action
May 2009	Addition of Nuvigil (armodafinil), the active ingredient or R-enantiomer of Provigil (modafinil), which is a mixture of the R- and S-enantiomers. Nuvigil shares the same indications as Provigil. The concentration-time profiles of the pure R-enantiomer following administration of 50mg Nuvigil or 100mg Provigil are nearly superimposable. The recommended daily dose of Nuvigil is 150mg or 250mg.
May 2009	PA quantity limits of Provigil 600mg or Nuvigil 300mg per day is recommended to safeguard patient health. There is no consistent evidence that there is any additional benefit beyond that of 200mg Provigil or 150mg Nuvigil per day. However, doses up to Provigil 600 mg per day, given as a single dose or in divided dose, have been well tolerated. Doses of Provigil

	800mg per day and above were shown to have higher incidence of side effects with no measurable improvement in symptom relief. Side effects include increased blood pressure and pulse rate (tachycardia). Due to the increased incidence of side effects with the increased dose, a change to the criteria is proposed to safeguard patient health.
October 2009	Addition of quantity limits.
August 2011	Documentation of acceptability of 600mg / day (modafinil). Some studies have shown additional benefit in daily doses greater than 400mg, up to 600mg / day (modafinil).
